

The T M Newburn Group remote telemetry system provides a reliable solution to the monitoring of your genset, be it either a gensafe unit or a stand alone generator. Upon activation, by either failure of the genset or a number of predefined inputs, the unit will immediately contact our central computer, which will then pass on the fault by either SMS or email to any number of users. Thus, a low fuel warning could be sent to a site manager or directly to the fuel company. Upon the fuel being delivered, or the fault cleared, the unit will immediately send its status to the users concerned, saving wasted site visits and down time of the generator. There are many further options available for this unit. Please contact our sales office to discuss this further.

Telemetry System offering:

- Tracker
- Low fuel warning
- Fuel management
- Low oil warning
- Low coolant warning
- Remote stop/start
- Remote inputs
- Timer start option
